

M-Files Copilot Connector Release Notes

Summary of the fixed issues and improvements in this release:

M-Files Copilot Connector (24.9.3.0)

Defect: Access control list in Microsoft Graph may not be correct

ID: T-171378

Symptom: Because of incorrect ACL calculations, in certain situations, the access control list of an object sent to the Microsoft Graph may not be identical to the object in M-Files.

Solution: Fixed. Changes in M-Files Server and Copilot connector.

There is also another update which will be included, but it is not security-related:

Improvement: User ID mappings are not cached

ID: T-171629

Symptom: When an internal M-Files user ID is converted to a Graph user ID, one query to the vault and one to the Graph are made. Whilst this mapping is static, the data is not cached.

Solution: Mapping cached, improving performance especially in larger scenarios.
